

**Randstad Belgium
Bluebox
Front-/Midoffice and extranet**

Project: Front-, Midoffice and extranet

Date: 12/2006

The project

Case

With the Rubens project, Randstad Belgium has the ambition to replace the current hard- and software (except the backoffice) with up to date technology.

One sub project, Bluebox, encloses the development of an entire front-, midoffice and extranet application.

Main motive for the project is the need for new functionalities due to an expansion of the core activities of Randstad.

The company has evolved from a pure supplier of temporary workers to a total HR services supplier.

Our deliverables

The development of the Bluebox application demands a broad analysis of the AS-IS and also the TO-BE business processes.

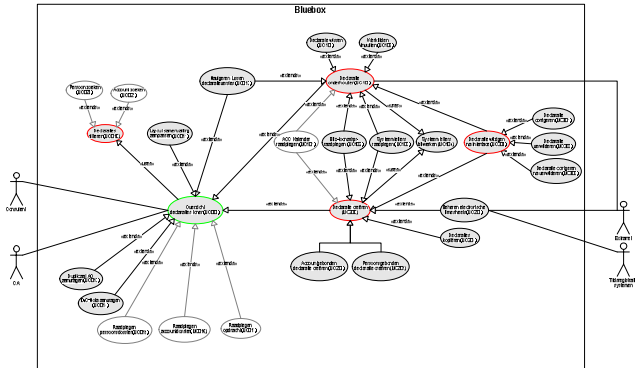

Followed by a transition to use-cases (level 2 and 3 of the Business Blueprint).

In order to create a supporting area within the organisation, we have created 4 different working groups: commercial, operational, administration and extranet, each with their own set of deliverables.

These groups were heterogenous: real business specialists, people who defined the policy and technical profiles. All working together to create one consistent goal.

Using the Business Blueprint model in an iterative way, Randstad will get an up to date result at delivery.
